

General Commons

QUERY THE GC USING GRAPHQL

Custom Database Queries

Getting Started with Querying the General Commons (GC) Database Using GraphQL

Users can now use GraphQL to query the General Commons (GC) database. Several custom queries are provided to help you get started. Follow the steps below to begin querying the database using Google Colab.

Preliminary steps to query using Google Colab:

1. Create a new notebook by selecting **File -> New Notebook**.
2. Install required python libraries: ***!pip install requests gql***
3. Set up the GraphQL client to interact with the API
4. Set up the GraphQL endpoint:
<https://general.datacommons.cancer.gov/v1/graphql/>
5. Start querying the GC database by using the example queries provided below to begin retrieving data from the GC database.

Austin – provide queries that users can use for the memgraph db

Example Queries:

Query #1

Database schema – see only what elements in the db:

Example:

```
{
  __schema{
    types{
      name,
      description,
      fields{
        name
      }
    }
  }
}
```

Query 2

Versions

versioning query:

```
{  
  version{  
    data_version_id  
    datetime  
    data_version  
    model_version  
    description  
  }  
}
```

Query #3

Query range of dates for files received at the GC

Query #4

List of participants in a study

Query #5

All metadata in a specific study

Query #6

Query all files in a specific study

Please add additional queries users might find useful in the GC.
